

# Generalized connections and Higgs fields on Lie algebroids

Nijmegen, April 5, 2016

**Thierry Masson**

Centre de Physique Théorique  
Campus de Luminy, Marseille

# Motivations

- Discovery of Higgs particle in 2012.
  - ➔ need for a mathematical validation of the Higgs sector in the SM.
  - 👎 No clue from “traditional” schemes and tools.
  
- **NCG:** Higgs field is part of a “generalized connection”.
 

Dubois-Violette, M., Kerner, R., and Madore, J. (1990). Noncommutative Differential Geometry and New Models of Gauge Theory. *J. Math. Phys.* 31, p. 323

Connes, A. and Lott, J. (1991). Particle models and noncommutative geometry. *Nucl. Phys. B Proc. Suppl.* 18.2, pp. 29–47

  - 👍 Models in NCG can reproduce the Standard Model up to the excitement connected to the diphoton resonance at 750 GeV “seen” by ATLAS and CMS!
  - 👎 Mathematical structures difficult to master by particle physicists.
  
- **Transitive Lie algebroids:**
  - ➔ generalized connections, gauge symmetries, Yang-Mills-Higgs models...
  - ➔ Direct filiation from Dubois-Violette, Kerner, and Madore (1990).
  - 👍 Mathematics close to “usual” mathematics of Yang-Mills theories.
  - 👎 No realistic theory yet.

# How to construct a gauge field theory?

The basic ingredients are:

- 1 A space of local symmetries (space-time dependence):  
→ a **gauge group**.
- 2 An implementation of the symmetry on matter fields:  
→ a **representation theory**.
- 3 A notion of derivation:  
→ some **differential structures**.
- 4 A (gauge compatible) replacement of ordinary derivations:  
→ a **covariant derivative**.
- 5 A way to write a gauge invariant Lagrangian density:  
→ **action functional**.

At least three mathematical schemes to construct gauge field theories:

- Ordinary differential geometry of principal fiber bundles.
- Noncommutative geometry.
- Transitive Lie algebroids (to be explained in this talk).

# Ordinary differential geometry

Given a  $G$ -principal fiber bundle  $\mathcal{P}$  over  $\mathcal{M}$ , the ingredients are

**gauge group:**  $\mathcal{G}(\mathcal{P})$  is the group of vertical automorphisms of  $\mathcal{P}$ .

**representation theory:** sections of associated vector bundles.

➔ Natural action of  $\mathcal{G}(\mathcal{P})$ .

**differential structures:** (ordinary) de Rham differential calculus.

**covariant derivative:** connection 1-form  $\omega$  on  $\mathcal{P}$ .

➔ covariant derivative on sections of any associated vector bundles.

**action functional:** integration on the base manifold  $\mathcal{M}$ , Killing form on the Lie algebra  $\mathfrak{g}$  of  $G$ , Hodge star operator, curvature of  $\omega$ .

# Noncommutative geometry

Given an associative algebra  $\mathbf{A}$ , the ingredients are

**representation theory:** a right module  $M$  over  $\mathbf{A}$ .

**gauge group:**  $\text{Aut}(M)$ , the group of automorphisms of the right module.

**differential structures:** any differential calculus defined on top of  $\mathbf{A}$ .

➔ many choices: spectral triples, derivations, twisted derivations...

**covariant derivatives:** noncommutative connections on  $M$ ,  
(need a differential calculus).

**action functional:** depends on the differential calculus.

- spectral triples: spectral action...
- derivation-based differential calculus: noncommutative integration, Hodge star operator, curvature of the connection...

## Generalities on Lie algebroids

$\mathcal{M}$  a smooth manifold,  $\Gamma(T\mathcal{M})$  the Lie algebra and  $C^\infty(\mathcal{M})$ -module of vector fields.

Definition in terms of algebras and modules (as in NCG).

### Definition (Lie algebroids)

A Lie algebroid  $A$  is a finite projective module over  $C^\infty(\mathcal{M})$  equipped with a Lie bracket  $[-, -]$  and a  $C^\infty(\mathcal{M})$ -linear Lie morphism  $\rho : A \rightarrow \Gamma(T\mathcal{M})$  such that

$$[\mathfrak{X}, f\mathfrak{Y}] = f[\mathfrak{X}, \mathfrak{Y}] + (\rho(\mathfrak{X}) \cdot f)\mathfrak{Y}$$

for any  $\mathfrak{X}, \mathfrak{Y} \in A$  and  $f \in C^\infty(\mathcal{M})$ .

$\rho$  is the anchor of  $A$ .

The usual definition uses the vector bundle  $\mathcal{A}$  such that  $A = \Gamma(\mathcal{A})$ .

$\mathcal{A}$  is viewed as a generalization of the tangent bundle.

➔ We will never use this point of view.

Natural notion of morphisms of Lie algebroids...

## Transitive Lie algebroids

A Lie algebroid  $A \xrightarrow{\rho} \Gamma(T\mathcal{M})$  is **transitive** if  $\rho$  is surjective.

### Proposition (The kernel of a transitive Lie algebroid)

Let  $A$  be a transitive Lie algebroid.

- $L = \text{Ker } \rho$  is a Lie algebroid with null anchor on  $\mathcal{M}$ .  
 $\Rightarrow L$  is called the **kernel** of  $A$ .
- The vector bundle  $\mathcal{L}$  such that  $L = \Gamma(\mathcal{L})$  is a locally trivial bundle in Lie algebras.  
 $\Rightarrow$  This gives the Lie structure on  $L$ .

One has the short exact sequence of Lie algebras and  $C^\infty(\mathcal{M})$ -modules

$$0 \longrightarrow L \xrightarrow{\iota} A \xrightarrow{\rho} \Gamma(T\mathcal{M}) \longrightarrow 0$$

This short exact sequence is the key structure of what follows...

Very trivial example:  $A = \Gamma(T\mathcal{M}) \Rightarrow L = 0$ .

## Example 1: Derivations of a vector bundle

$\mathcal{E}$  a vector bundle over  $\mathcal{M}$ .

$\text{Diff}^1(\mathcal{E})$  the space of first order differential operators on  $\mathcal{E}$ .

Symbol map:

$$\sigma : \text{Diff}^1(\mathcal{E}) \rightarrow \text{Hom}_{C^\infty(\mathcal{M})}(T^*\mathcal{M}, \text{End}(\mathcal{E})) \simeq \Gamma(T\mathcal{M} \otimes \text{End}(\mathcal{E})) \supset \Gamma(T\mathcal{M})$$

$$\mathfrak{D}(\mathcal{E}) = \sigma^{-1}(\Gamma(T\mathcal{M}))$$

is the transitive Lie algebroid of derivations of  $\mathcal{E}$ :

$$0 \longrightarrow \mathbf{A}(\mathcal{E}) \xrightarrow{\iota} \mathfrak{D}(\mathcal{E}) \xrightarrow{\sigma} \Gamma(T\mathcal{M}) \longrightarrow 0$$

with  $\mathbf{A}(\mathcal{E}) = \Gamma(\text{End}(\mathcal{E}))$  (0<sup>th</sup>-order diff. op.).

$\mathbf{A}(\mathcal{E})$  is an associative algebra (Lie structure is the commutator).

# Representation of a Lie algebroid

$A \xrightarrow{\rho} \Gamma(TM)$  a Lie algebroid and  $\mathcal{E} \rightarrow \mathcal{M}$  a vector bundle.

## Definition (Representation of a Lie algebroid)

A representation of  $A$  on  $\mathcal{E}$  is a morphism of Lie algebroids  $\phi : A \rightarrow \mathfrak{D}(\mathcal{E})$ .

When  $A$  is transitive, one has the commutative diagram of exact rows:

$$\begin{array}{ccccccccc}
 0 & \longrightarrow & L & \xrightarrow{\iota} & A & \xrightarrow{\rho} & \Gamma(TM) & \longrightarrow & 0 \\
 & & \downarrow \phi_L & & \downarrow \phi & & \parallel & & \\
 0 & \longrightarrow & \mathbf{A}(\mathcal{E}) & \xrightarrow{\iota} & \mathfrak{D}(\mathcal{E}) & \xrightarrow{\sigma} & \Gamma(TM) & \longrightarrow & 0
 \end{array}$$

$\phi_L : L \rightarrow \mathbf{A}(\mathcal{E})$  is a morphism of Lie algebras.

## Example 2: Atiyah Lie algebroids

$\mathcal{P} \xrightarrow{\pi} \mathcal{M}$  a  $G$ -principal fiber bundle,  $\mathfrak{g}$  the Lie algebra of  $G$ .

$R_g : \mathcal{P} \rightarrow \mathcal{P}$ ,  $R_g(p) = p \cdot g$ , the right action of  $G$  on  $\mathcal{P}$ .

$$\Gamma_G(T\mathcal{P}) = \{\mathfrak{X} \in \Gamma(T\mathcal{P}) / R_{g*}\mathfrak{X} = \mathfrak{X} \text{ for all } g \in G\}$$

$$\Gamma_G(\mathcal{P}, \mathfrak{g}) = \{v : \mathcal{P} \rightarrow \mathfrak{g} / v(p \cdot g) = \text{Ad}_{g^{-1}}v(p) \text{ for all } g \in G\}$$

Both are Lie algebras and  $C^\infty(\mathcal{M})$ -modules.

$\Gamma_G(T\mathcal{P}) = \pi_*$ -projectable vector fields in  $\Gamma(T\mathcal{P}) \xrightarrow{\pi_*} \Gamma(T\mathcal{M})$ .

$\iota : \Gamma_G(\mathcal{P}, \mathfrak{g}) \rightarrow \Gamma_G(T\mathcal{P})$  defined by  $\iota(v)|_p = v(p)|_p^{\mathcal{P}}$ ,

( $\mathfrak{g} \ni v \mapsto v^{\mathcal{P}}$  fundamental vector field on  $\mathcal{P}$ ).

S.E.S. of Lie algebras and  $C^\infty(\mathcal{M})$ -modules:

$$0 \longrightarrow \Gamma_G(\mathcal{P}, \mathfrak{g}) \xrightarrow{\iota} \Gamma_G(T\mathcal{P}) \xrightarrow{\pi_*} \Gamma(T\mathcal{M}) \longrightarrow 0$$

$\Gamma_G(T\mathcal{P})$  is the transitive **Atiyah Lie algebroid** associated to  $\mathcal{P}$

The representations of  $\Gamma_G(T\mathcal{P})$  are given by the associated vector bundles to  $\mathcal{P}$ .

## Example 3: Trivial Lie algebroids

**Trivial Lie algebroid** = Atiyah Lie algebroid of a trivial principal bundle  $\mathcal{M} \times G$ .

Concrete description in terms of the bundle  $T\mathcal{M} \oplus (\mathcal{M} \times \mathfrak{g})$ :

- $C^\infty(\mathcal{M})$ -module:  $\text{TLA}(\mathcal{M}, \mathfrak{g}) \equiv A = \Gamma(T\mathcal{M} \oplus (\mathcal{M} \times \mathfrak{g}))$ .
- Bracket:  $[X \oplus \gamma, Y \oplus \eta] = [X, Y] \oplus (X \cdot \eta - Y \cdot \gamma + [\gamma, \eta])$
- Anchor:  $\rho(X \oplus \gamma) = X$ .
- Kernel:  $L = \Gamma(\mathcal{M} \times \mathfrak{g})$  (section of a trivial bundle).

### Proposition

*Every transitive Lie algebroid  $A$  is locally of the form  $\text{TLA}(\mathcal{U}, \mathfrak{g})$  for  $\mathcal{U} \subset \mathcal{M}$  open subset.*

Trivialization of an Atiyah Lie algebroid  $\Gamma_G(T\mathcal{P}) \leftrightarrow$  Trivialization of  $\mathcal{P}$ .

# Differential structures

1 Lie algebroids and their representations

**2 Differential structures**

3 Connections and covariant derivatives

4 The gauge group

5 Structures to construct an action functional

6 Gauge theories

# Differential forms: general definition

A Lie algebroid,  $\phi : A \rightarrow \mathfrak{D}(\mathcal{E})$  a representation of  $A$  on  $\mathcal{E}$ .

## Definition (Differential forms)

For  $p \in \mathbb{N}$ , let  $\Omega^p(A, \mathcal{E})$  be the linear space of  $C^\infty(\mathcal{M})$ -multilinear antisymmetric maps  $A^p \rightarrow \Gamma(\mathcal{E})$ .

For  $p = 0$ , let  $\Omega^0(A, \mathcal{E}) = \Gamma(\mathcal{E})$ .

$\Omega^\bullet(A, \mathcal{E}) = \bigoplus_{p \geq 0} \Omega^p(A, \mathcal{E})$  is equipped with the natural differential

$$\begin{aligned} (\widehat{d}_\phi \widehat{\omega})(\mathfrak{X}_1, \dots, \mathfrak{X}_{p+1}) &= \sum_{i=1}^{p+1} (-1)^{i+1} \phi(\mathfrak{X}_i) \cdot \widehat{\omega}(\mathfrak{X}_1, \dots, \overset{i}{\cdot} \dots, \mathfrak{X}_{p+1}) \\ &\quad + \sum_{1 \leq i < j \leq p+1} (-1)^{i+j} \widehat{\omega}([\mathfrak{X}_i, \mathfrak{X}_j], \mathfrak{X}_1, \dots, \overset{i}{\cdot} \dots \overset{j}{\cdot} \dots, \mathfrak{X}_{p+1}) \end{aligned}$$

$\phi(\mathfrak{X}) \cdot \varphi$  is the action of the first order diff. op.  $\phi(\mathfrak{X})$  on  $\varphi \in \Gamma(\mathcal{E})$ .

One has  $\widehat{d}_\phi^2 = 0$  (since  $\phi$  is a morphism of Lie algebras).

## Differential forms: two examples

$$\mathcal{E} = \mathcal{M} \times \mathbb{C} \rightarrow \Gamma(\mathcal{E}) = C^\infty(\mathcal{M}).$$

The anchor map is a representation of  $A$  on  $C^\infty(\mathcal{M})$  via vector fields.

### Definition (Forms with values in $C^\infty(\mathcal{M})$ )

$(\Omega^\bullet(A), \widehat{d}_A)$  is the graded commutative differential algebra of forms on  $A$  with values in  $C^\infty(\mathcal{M})$  associated to the anchor as a representation.

$$0 \longrightarrow L \xrightarrow{\iota} A \xrightarrow{\rho} \Gamma(T\mathcal{M}) \longrightarrow 0 \text{ a transitive Lie algebroid.}$$

$\mathcal{E} = \mathcal{L}$  the vector bundle such that  $L = \Gamma(\mathcal{L})$ .

For  $\mathfrak{X} \in A$  and  $\ell \in L$ , define  $\text{ad}_{\mathfrak{X}}(\ell) \in L$  such that  $\iota(\text{ad}_{\mathfrak{X}}(\ell)) = [\mathfrak{X}, \iota(\ell)]$  (adjoint representation of  $A$  on  $\mathcal{L}$ ).

### Definition (Forms with values in the kernel)

$(\Omega^\bullet(A, L), \widehat{d})$  is the graded differential Lie algebra of forms on  $A$  with values in the kernel  $L$  associated to the adjoint representation.

This differential space is a graded Lie algebra and a graded differential module on the graded commutative differential algebra  $\Omega^\bullet(A)$ .

## Differential forms on trivial Lie algebroids

$A = \text{TLA}(\mathcal{M}, \mathfrak{g})$  a trivial Lie algebroid.

$\Omega^\bullet(A)$  is the total complex of the bigraded commutative algebra  $\Omega^\bullet(\mathcal{M}) \otimes \wedge^\bullet \mathfrak{g}^*$ .

$\widehat{d}_A = d + s$  with

$d : \Omega^\bullet(\mathcal{M}) \otimes \wedge^\bullet \mathfrak{g}^* \rightarrow \Omega^{\bullet+1}(\mathcal{M}) \otimes \wedge^\bullet \mathfrak{g}^*$       de Rham differential

$s : \Omega^\bullet(\mathcal{M}) \otimes \wedge^\bullet \mathfrak{g}^* \rightarrow \Omega^\bullet(\mathcal{M}) \otimes \wedge^{\bullet+1} \mathfrak{g}^*$       Chevalley-Eilenberg differential

$\Omega^\bullet(A, L)$  is the total complex of the bigraded Lie algebra  $\Omega^\bullet(\mathcal{M}) \otimes \wedge^\bullet \mathfrak{g}^* \otimes \mathfrak{g}$ .

$\widehat{d} = d + s'$  with

$s'$  the Chevalley-Eilenberg differential on  $\wedge^\bullet \mathfrak{g}^* \otimes \mathfrak{g}$  (for the ad rep.).

Compact notation  $(\Omega_{\text{TLA}}^\bullet(\mathcal{M}, \mathfrak{g}), \widehat{d}_{\text{TLA}})$ .

**This is the model for trivializations of forms on any transitive Lie algebroid.**

⚠ Mathematical structure similar to the one used in BRST differential algebras.

➡ work in progress to understand possible relations...

# Differential forms on Atiyah Lie algebroids

Let  $\mathcal{P}$  be the Atiyah Lie algebroid of the  $G$ -principal fiber bundle  $\mathcal{P} \xrightarrow{\pi} \mathcal{M}$ .

$(\Omega_{\text{Lie}}^{\bullet}(\mathcal{P}, \mathfrak{g}), \widehat{d})$  the complex of forms with values in the kernel.

$$\mathfrak{g}_{\text{equ}} = \{\xi^{\mathcal{P}} \oplus \xi \mid \xi \in \mathfrak{g}\} \subset \text{TLA}(\mathcal{P}, \mathfrak{g}) = \Gamma(T\mathcal{P} \oplus (\mathcal{P} \times \mathfrak{g}))$$

is a Lie sub-algebra, which defines a Cartan operation on  $(\Omega_{\text{TLA}}^{\bullet}(\mathcal{P}, \mathfrak{g}), \widehat{d}_{\text{TLA}})$ .

$(\Omega_{\text{TLA}}^{\bullet}(\mathcal{P}, \mathfrak{g})_{\mathfrak{g}_{\text{equ}}}, \widehat{d}_{\text{TLA}})$  the differential graded subcomplex of **basic elements**.

## Theorem (S. Lazzarini, T.M.)

*If  $G$  is connected and simply connected then*

$$(\Omega_{\text{Lie}}^{\bullet}(\mathcal{P}, \mathfrak{g}), \widehat{d}) \text{ is isomorphic to } (\Omega_{\text{TLA}}^{\bullet}(\mathcal{P}, \mathfrak{g})_{\mathfrak{g}_{\text{equ}}}, \widehat{d}_{\text{TLA}})$$

$$\rightarrow \Omega_{\text{Lie}}^{\bullet}(\mathcal{P}, \mathfrak{g}) \subset \Omega_{\text{TLA}}^{\bullet}(\mathcal{P}, \mathfrak{g}) \simeq \Omega^{\bullet}(\mathcal{P}) \otimes \wedge^{\bullet} \mathfrak{g}^* \otimes \mathfrak{g}.$$

## The global picture so far

- Transitive Lie algebroids = s.e.s. of Lie algebras and  $C^\infty(\mathcal{M})$ -modules

$$0 \longrightarrow L \xrightarrow{\iota} A \xrightarrow{\rho} \Gamma(TM) \longrightarrow 0$$

- Generalized forms:  $(\Omega^\bullet(A, L), \widehat{d})$ , graded differential Lie algebra.
  - ➔ “Contains” ordinary de Rham calc. on  $\mathcal{M}$  (basic elements for op. of  $L$ ).
- Local description of transitive Lie algebroids and diff. calc. using TLA.
  - ➔  $(\Omega^\bullet(\mathcal{M}) \otimes \wedge^\bullet \mathfrak{g}^* \otimes \mathfrak{g}, \widehat{d} = d + s')$ .
  - ➔ useful for computations and definitions of structures...
- Representation theory on derivations of a vector bundle.

$$\begin{array}{ccccccccc} 0 & \longrightarrow & L & \xrightarrow{\iota} & A & \xrightarrow{\rho} & \Gamma(TM) & \longrightarrow & 0 \\ & & \downarrow \phi_L & & \downarrow \phi & & \parallel & & \\ 0 & \longrightarrow & \mathbf{A}(\mathcal{E}) & \xrightarrow{\iota} & \mathfrak{D}(\mathcal{E}) & \xrightarrow{\sigma} & \Gamma(TM) & \longrightarrow & 0 \end{array}$$

- 5 Structures to construct an action functional
- 6 Gauge theories

## Ordinary connections

$0 \longrightarrow L \xrightarrow{\iota} A \xrightarrow{\rho} \Gamma(TM) \longrightarrow 0$  a transitive Lie algebroid.

### Definition (Connection on a transitive Lie algebroid)

A connection on  $A$  is a splitting  $\nabla : \Gamma(TM) \rightarrow A$  as  $C^\infty(\mathcal{M})$ -modules of the s.e.s.

$$0 \longrightarrow L \xleftarrow{\omega^\nabla} A \xleftarrow{\nabla} \Gamma(TM) \longrightarrow 0$$

*(Note: The diagram above is a simplified representation of the commutative diagram in the image. The original diagram shows a sequence of maps:  $0 \rightarrow L \xrightarrow{\iota} A \xrightarrow{\rho} \Gamma(TM) \rightarrow 0$ . A curved arrow labeled  $\omega^\nabla$  points from  $A$  to  $L$ , and another curved arrow labeled  $\nabla$  points from  $\Gamma(TM)$  to  $A$ . The maps  $\iota$  and  $\rho$  are also indicated below the arrows.)*

The curvature of  $\nabla$  is defined as the obstruction to be a morphism of Lie algebras:

$$R(X, Y) = [\nabla_X, \nabla_Y] - \nabla_{[X, Y]} \in \iota(L)$$

$\nabla$  defines  $\omega^\nabla : A \rightarrow L$  (s.e.s. properties) s.t.  $\mathfrak{X} = \nabla_X - \iota \circ \omega^\nabla(\mathfrak{X})$ ,  $\mathfrak{X} \in A$ ,  $X = \rho(\mathfrak{X})$ .

### Proposition

One has  $\omega^\nabla \in \Omega^1(A, L)$  and  $\omega^\nabla \circ \iota(\ell) = -\ell$  for any  $\ell \in L$  (normalization on  $L$ ).

The 2-form  $R^\nabla \in \Omega^2(A, L)$  defined by  $R^\nabla(\mathfrak{X}, \mathfrak{Y}) = (\widehat{d}\omega^\nabla)(\mathfrak{X}, \mathfrak{Y}) + [\omega^\nabla(\mathfrak{X}), \omega^\nabla(\mathfrak{Y})]$  vanishes when  $\mathfrak{X}$  or  $\mathfrak{Y}$  in  $\iota(L)$ , and one has  $\iota \circ R^\nabla(\mathfrak{X}, \mathfrak{Y}) = R(X, Y)$ .

$\omega^\nabla$  is the connection 1-form associated to  $\nabla$ .

# Ordinary connections on Atiyah Lie algebroid

$$0 \longrightarrow \Gamma_G(\mathcal{P}, \mathfrak{g}) \xrightarrow{\iota} \Gamma_G(T\mathcal{P}) \xrightarrow{\pi_*} \Gamma(T\mathcal{M}) \longrightarrow 0$$

## Proposition (Connections)

*Ordinary connection on the Atiyah Lie algebroid = connection on  $\mathcal{P}$ .*

*The notions of curvature coincide.*

➔ This example explains the terminology “ordinary connection”.

## The geometric equivalence:

A connection on  $\mathcal{P}$  defines the horizontal lift  $\Gamma(T\mathcal{M}) \rightarrow \Gamma_G(T\mathcal{P}), X \mapsto X^h$ .

## The algebraic equivalence:

Suppose  $G$  is connected and simply connected.

$\omega^{\mathcal{P}} \in \Omega^1(\mathcal{P}) \otimes \mathfrak{g}$  a connection 1-form on  $\mathcal{P}$ .

$\theta \in \mathfrak{g}^* \otimes \mathfrak{g}$  the Maurer-Cartan 1-form on  $G$ .

$\widehat{\omega}_{\mathfrak{g}_{\text{equ}}} = \omega^{\mathcal{P}} - \theta \in \Omega_{\text{TLA}}^1(\mathcal{P}, \mathfrak{g}) \subset \Omega^\bullet(\mathcal{P}) \otimes \wedge^\bullet \mathfrak{g}^* \otimes \mathfrak{g}$  is  $\mathfrak{g}_{\text{equ}}$ -basic.

It corresponds to the connection 1-form  $\omega^\nabla \in \Omega_{\text{Lie}}^1(\mathcal{P}, \mathfrak{g})$  associated to  $\omega^{\mathcal{P}}$ .

# Generalized connections

## Definition (Generalized connection)

A generalized connection on a transitive Lie algebroid  $A$  is a 1-form  $\widehat{\omega} \in \Omega^1(A, L)$ .

The curvature of  $\widehat{\omega}$  is the 2-form  $\widehat{R} = \widehat{d}\widehat{\omega} + \frac{1}{2}[\widehat{\omega}, \widehat{\omega}] \in \Omega^2(A, L)$ .

A generalized connection is an ordinary connection iff  $\widehat{\omega} \circ \iota = -\text{Id}_L$ .

Consider a representation of  $A$  on  $\mathcal{E}$ :

$$\begin{array}{ccccccccc}
 0 & \longrightarrow & L & \xleftarrow{\widehat{\omega}} & A & \xrightarrow{\rho} & \Gamma(T\mathcal{M}) & \longrightarrow & 0 \\
 & & \phi_L \downarrow & & \widehat{\nabla} \downarrow \phi & & \parallel & & \\
 0 & \longrightarrow & \mathbf{A}(\mathcal{E}) & \xrightarrow{\iota} & \mathfrak{D}(\mathcal{E}) & \xrightarrow{\sigma} & \Gamma(T\mathcal{M}) & \longrightarrow & 0
 \end{array}$$

$\widehat{\omega}$  defines  $\widehat{\nabla} : A \rightarrow \mathfrak{D}(\mathcal{E})$  by  $\widehat{\nabla}_{\mathfrak{X}} = \phi(\mathfrak{X}) + \iota \circ \phi_L(\widehat{\omega}(\mathfrak{X}))$ .

This is the **covariant derivative** on  $\mathcal{E}$  associated to  $\widehat{\omega}$ .

$[\widehat{\nabla}_{\mathfrak{X}}, \widehat{\nabla}_{\mathfrak{Y}}] - \widehat{\nabla}_{[\mathfrak{X}, \mathfrak{Y}]} = \iota \circ \phi_L \circ \widehat{R}(\mathfrak{X}, \mathfrak{Y}) \rightarrow \widehat{\nabla}$  is not a representation in general.

Other terminologies for  $\widehat{\nabla}$ : “generalized representation”, “ $A$ -connection”...

# Generalized connections on Atiyah Lie algebroids

$$0 \longrightarrow \Gamma_G(\mathcal{P}, \mathfrak{g}) \xrightarrow{\iota} \Gamma_G(T\mathcal{P}) \xrightarrow{\pi_*} \Gamma(T\mathcal{M}) \longrightarrow 0$$

To simplify the presentation: suppose  $G$  is connected and simply connected.

A generalized connection  $\widehat{\omega}$  on  $\Gamma_G(T\mathcal{P})$  is a  $\mathfrak{g}_{\text{equ}}$ -basic 1-form  $\widehat{\omega}_{\mathfrak{g}_{\text{equ}}} \in \Omega_{\text{TLA}}^1(\mathcal{P}, \mathfrak{g})$ .

$$\widehat{\omega}_{\mathfrak{g}_{\text{equ}}} = \omega + \varphi \in (\Omega^1(\mathcal{P}) \otimes \mathfrak{g}) \oplus (C^\infty(\mathcal{P}) \otimes \mathfrak{g}^* \otimes \mathfrak{g}).$$

## Proposition (Ordinary versus generalized connections)

If  $\varphi = -\theta$ , then  $\widehat{\omega}$  is an ordinary connection on  $\Gamma_G(T\mathcal{P})$ .

➔  $\omega$  is an (ordinary) connection 1-form on  $\mathcal{P}$ .

Otherwise,  $\varphi + \theta$  measures the deviation of  $\widehat{\omega}$  from an ordinary connection.

➔  $\varphi + \theta \simeq$  Higgs scalar fields...

## Connections: a summary

- Ordinary connection on a transitive Lie algebroid = splitting:

$$0 \longrightarrow L \xrightarrow{\iota} A \xrightarrow{\rho} \Gamma(TM) \longrightarrow 0$$

$\omega^\nabla$  (curved arrow from  $A$  to  $L$ )  
 $\nabla$  (curved arrow from  $\Gamma(TM)$  to  $A$ )

$\nabla \mapsto \omega^\nabla \in \Omega^1(A, L)$  connection 1-form, curvature as a 2-form.

- Generalized connections are any 1-forms  $\widehat{\omega} \in \Omega^1(A, L)$ .
  - $\mapsto$  Covariant derivatives on representations.
  - $\mapsto$  Notion of curvature.
- Ordinary connection = normalized generalized connection:
  - $\widehat{\omega} \circ \iota(\ell) = -\ell$  for any  $\ell \in L$
- For Atiyah Lie algebroids:
  - space of ordinary connections on  $\mathcal{P} \subset$  space of generalized connections;
  - connection 1-forms and curvatures are directly related in  $\Omega_{\text{TLA}}^\bullet(\mathcal{P}, \mathfrak{g})$ .

6 Gauge theories

## The gauge group

## Gauge group of a representation

Suppose given a representation of a transitive Lie algebroid  $A$  on  $\mathcal{E}$ :

$$\begin{array}{ccccccccc}
 0 & \longrightarrow & L & \xrightarrow{\iota} & A & \xrightarrow{\rho} & \Gamma(T\mathcal{M}) & \longrightarrow & 0 \\
 & & \phi_L \downarrow & & \downarrow \phi & & \parallel & & \\
 0 & \longrightarrow & \mathbf{A}(\mathcal{E}) & \xrightarrow{\iota} & \mathfrak{D}(\mathcal{E}) & \xrightarrow{\sigma} & \Gamma(T\mathcal{M}) & \longrightarrow & 0
 \end{array}$$

**Definition (Gauge group of a representation)**

The gauge group of  $\mathcal{E}$  is the group  $\text{Aut}(\mathcal{E}) \subset \mathbf{A}(\mathcal{E})$  (vertical automorphisms of  $\mathcal{E}$ ).

No (finite) gauge transformation at the level of  $A$  (similar situation in NCG).

Any  $\xi \in L$  defines an infinitesimal gauge transformation on  $\Gamma(\mathcal{E})$  by  $\varphi \mapsto \phi_L(\xi)\varphi$ .

**Definition (Infinitesimal gauge transformations)**

An infinitesimal gauge transformation on  $A$  is an element  $\xi \in L$ .

## The gauge group

## Gauge transformations

$$\xi \in L \rightarrow g = e^{\phi_L(\xi)} \simeq 1 + \phi_L(\xi) + \dots \in \text{Aut}(\mathcal{E}) \subset \mathbf{A}(\mathcal{E})$$

$\widehat{\omega}$  generalized connection on  $A$ , and  $\widehat{\nabla}$  its associated covariant derivative on  $\mathcal{E}$ :

$$\widehat{\nabla}_{\mathfrak{X}}\varphi = \phi(\mathfrak{X}) \cdot \varphi + \phi_L(\widehat{\omega}(\mathfrak{X}))\varphi$$

The first order diff. op.  $\widehat{\nabla}_{\mathfrak{X}}^g = g^{-1} \circ \widehat{\nabla}_{\mathfrak{X}} \circ g$  on  $\mathcal{E}$  can be written as

$$\widehat{\nabla}_{\mathfrak{X}}^g\varphi = \phi(\mathfrak{X}) \cdot \varphi + \phi_L(\widehat{\omega}(\mathfrak{X}))\varphi + \phi_L(\widehat{d}\xi(\mathfrak{X}) + [\widehat{\omega}(\mathfrak{X}), \xi])\varphi + O(\xi^2)\varphi$$

## Definition (Infinitesimal gauge variation)

The infinitesimal gauge variation of  $\widehat{\omega}$  induced by  $\xi$  is defined to be  $\widehat{d}\xi + [\widehat{\omega}, \xi]$ .

→ The infinitesimal gauge variation of the curvature  $\widehat{R}$  of  $\widehat{\omega}$  is  $[\widehat{R}, \xi]$ .

The gauge principle is implemented on  $A$  at the infinitesimal level (indep. of a rep.).

→ Similar to ordinary differential geometry.

## The gauge group

## Gauge transformations on Atiyah Lie algebroids

$$0 \longrightarrow \Gamma_G(\mathcal{P}, \mathfrak{g}) \xrightarrow{\iota} \Gamma_G(T\mathcal{P}) \xrightarrow{\pi_*} \Gamma(TM) \longrightarrow 0$$

$\mathcal{G}(\mathcal{P})$  the gauge group of  $\mathcal{P}$  (vertical automorphisms of  $\mathcal{P}$ ).

$u \in \mathcal{G}(\mathcal{P})$  is a  $G$ -equivariant map  $u : \mathcal{P} \rightarrow G$ ,  $u(p \cdot g) = g^{-1}u(p)g$ .

- **Finite gauge transformations are defined.**
- $L = \Gamma_G(\mathcal{P}, \mathfrak{g})$  is the Lie algebra of  $\mathcal{G}(\mathcal{P})$ .
- Infinitesimal (usual) gauge transformations are elements in  $L$ .

$\widehat{\omega} \in \Omega_{\text{Lie}}^1(\mathcal{P}, \mathfrak{g})$  and  $u \in \mathcal{G}(\mathcal{P})$ .

Define  $\widehat{\omega}^u(\mathfrak{X}) = u^{-1}\widehat{\omega}(\mathfrak{X})u + u^{-1}(\mathfrak{X} \cdot u)$  for any  $\mathfrak{X} \in \Gamma_G(T\mathcal{P})$ .

- $\widehat{\omega}^u \in \Omega_{\text{Lie}}^1(\mathcal{P}, \mathfrak{g})$ ;
- induced by  $\widehat{\nabla} \mapsto \widehat{\nabla}^u$ ;
- infinitesimal gauge transformations on  $\widehat{\omega}$  are induced by  $\widehat{\omega} \mapsto \widehat{\omega}^u$ ;
- restricts to (ordinary) gauge transformation on ordinary connections...  
 ➔ preserves the decomposition  $\omega^{\mathcal{P}} - \theta$ .

## Structures to construct an action functional

# Structures to construct an action functional

1 Lie algebroids and their representations

2 Differential structures

3 Connections and covariant derivatives

4 The gauge group

**5 Structures to construct an action functional**

6 Gauge theories

## Metrics on transitive Lie algebroids

All the structures rely on a notion of metric...

### Definition (Metric on a Lie algebroid)

A metric on  $A$  is a symmetric  $C^\infty(\mathcal{M})$ -linear map  $\widehat{g} : A \otimes_{C^\infty(\mathcal{M})} A \rightarrow C^\infty(\mathcal{M})$ .

$\widehat{g}$  defines a metric  $h = \iota^*\widehat{g}$  on  $L$  given by  $h(\gamma, \eta) = \widehat{g}(\iota(\gamma), \iota(\eta))$  for any  $\gamma, \eta \in L$ .

→  $\widehat{g}$  is **inner non degenerate** if  $h$  is non degenerate on  $L$ .

### Proposition (C. Fournel, S. Lazzarini, T.M.)

An inner non degenerate metric  $\widehat{g}$  on  $A$  is equivalent to a triple  $(g, h, \nabla)$  where

- $g$  is a (possibly degenerate) metric on  $\mathcal{M}$ ;
- $h$  is a non degenerate metric on  $L$ ;
- $\nabla$  is an ordinary connection on  $A$ , with  $\mathring{\omega} \in \Omega^1(A, L)$  its connection 1-form;
- $\widehat{g}(\mathfrak{X}, \mathfrak{Y}) = g(\rho(\mathfrak{X}), \rho(\mathfrak{Y})) + h(\mathring{\omega}(\mathfrak{X}), \mathring{\omega}(\mathfrak{Y}))$ .
- $\widehat{g}(\nabla_X, \iota(\gamma)) = 0$  for any  $X \in \Gamma(TM)$  and  $\gamma \in L$ .

Given  $\widehat{g}$ , look at  $\mathring{\omega}$  as a background connection...

## Integration along the kernel

$\nabla$  a connection on  $A$ ,  $\hat{\omega} \in \Omega^1(A, L)$  its connection 1-form.

$h$  a metric on  $L$ .

Suppose  $\mathcal{L}$  is orientable where  $L = \Gamma(\mathcal{L})$  ( $\Rightarrow A$  is called inner orientable), let  $n = \text{rank}(\mathcal{L})$ .

### Proposition (Volume form along $L$ and inner integration)

$h$  and  $\hat{\omega}$  define a global form in  $\Omega^\bullet(A)$  of maximal degree in the  $L$  direction.

This volume form defines integrations

$$\int_{\text{inner}} : \Omega^\bullet(A) \rightarrow \Omega^{\bullet-n}(\mathcal{M}) \qquad \int_{\text{inner}} : \Omega^\bullet(A, L) \rightarrow \Omega^{\bullet-n}(\mathcal{M}, \mathcal{L}).$$

They do not depend on  $\nabla$ .

$\Rightarrow$  After integration, only geometrical structures (de Rham).

## Integration on $A$

Suppose also that  $\mathcal{M}$  is orientable ( $\Rightarrow A$  is called orientable) and  $g$  non degenerate.

### Definition (Integration on $A$ )

Using  $g$ , the integration on  $A$  of a form  $\widehat{\omega} \in \Omega^\bullet(A)$  is defined by

$$\int_A \widehat{\omega} = \int_{\mathcal{M}} \int_{\text{inner}} \widehat{\omega} \in \mathbb{C}.$$

### Definition (Scalar product of forms)

The scalar product of any 2 forms  $\widehat{\omega}_1, \widehat{\omega}_2 \in \Omega^\bullet(A, L)$  is defined by

$$\langle \widehat{\omega}_1, \widehat{\omega}_2 \rangle = \int_A h(\widehat{\omega}_1, \widehat{\omega}_2) \in \mathbb{C}$$

## Metrics: a summary

A non degenerate metric  $\widehat{g} = (g, h, \nabla)$ , with  $\nabla \leftrightarrow \mathring{\omega} \in \Omega^1(A, L)$ , gives us:

- $h \mapsto$  scalar product on  $L$ ;
- $h, \mathring{\omega} \mapsto$  integration along  $L$ ;
- $g \mapsto$  integration on  $\mathcal{M}$ ;
- $g, h, \mathring{\omega} \mapsto$  integration on  $A$ ;
- $g, h, \mathring{\omega} \mapsto$  Hodge star operator (straightforward to define)
 
$$\star : \Omega^p(A, L) \rightarrow \Omega^{m+n-p}(A, L)$$

- 6 Gauge theories**

## Gauge invariant action

A orientable transitive Lie algebroid,  $\widehat{g} = (g, h, \nabla)$  non degenerate metric.

Suppose  $h$  is a Killing metric:  $h([\xi, \gamma], \eta) + h(\gamma, [\xi, \eta]) = 0$  for any  $\gamma, \eta, \xi \in L$ .

$\widehat{\omega} \in \Omega^1(A, L)$  a connection on  $A$  and  $\widehat{R}$  its curvature 2-form.

### Proposition (C. Fournel, S. Lazzarini, T.M.)

*The action functional*

$$\mathcal{S}_{\text{Gauge}}[\widehat{\omega}] = \langle \widehat{R}, \star \widehat{R} \rangle = \int_A h(\widehat{R}, \star \widehat{R}).$$

*is invariant under infinitesimal gauge transformations in  $L$ .*

### Example (Atiyah Lie algebroid)

$A$  the Atiyah Lie algebroid of a  $G$ -principal fiber bundle  $\mathcal{P}$ .

$h$  induced by the Killing form on  $\mathfrak{g}$  (semisimple).

$\widehat{\omega}$  any generalized connection  $\rightarrow \mathcal{S}_{\text{Gauge}}[\widehat{\omega}]$  is  $\mathcal{G}(\mathcal{P})$ -gauge invariant.

$\widehat{\omega}$  an ordinary connection on  $A \rightarrow \mathcal{S}_{\text{Gauge}}[\widehat{\omega}]$  is the ordinary Yang-Mills action.

Possible to define  $\mathcal{S}_{\text{Matter}}[\varphi, \widehat{\omega}]$  for  $\varphi \in \Gamma(\mathcal{E})$  where  $A \rightarrow \mathfrak{D}(\mathcal{E})$  is a representation of  $A$ .

## Decomposition of a connection

$\widehat{\omega} \in \Omega^1(A, L)$  a generalized connection on  $A$ .

$\tau \in \text{End}(\mathcal{L})$  defined by

$$\tau = \widehat{\omega} \circ \iota + \text{Id}_L.$$

$\tau$  vanishes iff  $\widehat{\omega}$  is an ordinary connection on  $A$

➔ measures the “non Yang-Mills” part (Higgs scalar fields).

⚠  $\tau$  is not a Lie morphism.

$\widehat{g} = (g, h, \nabla)$  metric with  $\nabla \leftrightarrow \mathring{\omega} \in \Omega^1(A, L)$ .

### Proposition

$\omega = \widehat{\omega} + \tau(\mathring{\omega}) \in \Omega^1(A, L)$  is an ordinary connection on  $A$ .

The induced infinitesimal gauge action of  $L$  is the one on ordinary connections.

$\widehat{g} = (g, h, \nabla)$  decomposes any connection  $\widehat{\omega}$  on  $A$  as:

$\widehat{\omega} \leftrightarrow (\omega, \tau)$  ordinary connection on  $A$  + algebraic object on  $L$

$\widehat{\omega}$  ordinary connection ➔  $\tau = 0$  ➔  $\omega = \widehat{\omega}$ .

# The total action functional

Using the decomposition  $\widehat{\omega} \leftrightarrow (\omega, \tau)$ :

$$\mathcal{S}_{\text{Gauge}}[\widehat{\omega}] + \mathcal{S}_{\text{Matter}}[\varphi, \widehat{\omega}] = \begin{array}{l} \text{(1) Yang-Mills like term for } \omega \\ \text{(2) covariant derivative for } \tau \text{ along } \omega \\ \text{(3) potential for } \tau \\ \text{(4) covariant derivative for } \varphi \text{ along } \omega \\ \text{(5) coupling } \varphi \leftrightarrow \tau \end{array}$$

The potential (3) can vanish for  $\tau \neq 0$ .

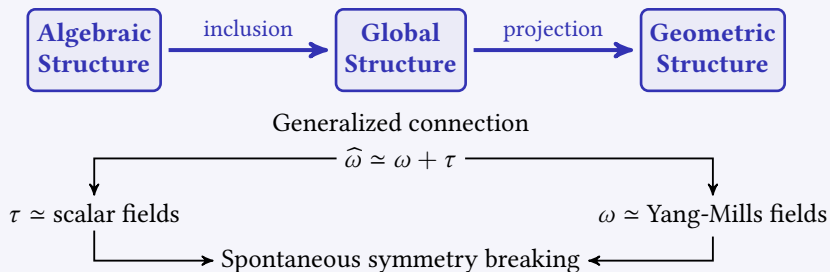

A development around a solution  $\tau_0 \neq 0$  induces:

- A mass term for the ordinary connection  $\omega$  in (2).
- A mass term for  $\varphi$  in (5).
  - ➔ Massive bosons ( $\omega$ ) coupled to massive particles ( $\varphi$ ).
  - ➔ Yang-Mills-Higgs type gauge theory.

## Conclusion

# Why Higgs fields?

A pattern for Yang-Mills-Higgs gauge field theories (on “ordinary space-time”):

Transitive Lie algebroids:  $0 \longrightarrow L \longrightarrow A \longrightarrow \Gamma(TM) \longrightarrow 0$

NCG:  $1 \longrightarrow \text{Inn}(\mathbf{A}) \longrightarrow \text{Aut}(\mathbf{A}) \longrightarrow \text{Out}(\mathbf{A}) \longrightarrow 1$

Franois, J., Lazzarini, S., and Masson, T. (2014). “Gauge field theories: various mathematical approaches”.

In: *Mathematical Structures of the Universe*. Ed. by Eckstein, M., Heller, M., and Szybka, S. J. Kraków, Poland: Copernicus Center Press, pp. 177–225

## Conclusion

- (Geometric) Gauge field theories can be generalized in at least two directions:
  - Noncommutative Geometry
  - Transitive Lie Algebroids.
- Same pattern: add some purely algebraic directions to space-time.
  - ➔ Yang-Mills-Higgs type gauge theories.
- Gauge theories on Atiyah Lie algebroids are close to Yang-Mills gauge theories.
  - They contain ordinary gauge theories used in physics.
  - They share common mathematical structures.
  - No restriction on the gauge group.
- A lot more to investigate:
  - Relation to BRST structures...
  - Construction of realistic models...
  - Relation with “dressing field” method elaborated in Fournel, C., François, J., Lazzarini, S., and Masson, T. (2014). Gauge invariant composite fields out of connections, with examples. *Int. J. Geom. Methods Mod. Phys.* 11.1, p. 1450016
  - Here, generalization of Ehresman’s connections:
    - ➔ we investigate generalization of Cartan’s connections (used in gravitational and conformal theories).

## Trivialization of transitive Lie algebroids

$0 \longrightarrow L \xrightarrow{\iota} A \xrightarrow{\rho} \Gamma(TM) \longrightarrow 0$  a transitive Lie algebroid.

A local trivialization of  $A$  is a triple  $(\mathcal{U}, \Psi, \nabla^0)$  where

- $\mathcal{U}$  is an open subset of  $\mathcal{M}$ ;
- $\Psi : \Gamma(\mathcal{U} \times \mathfrak{g}) \xrightarrow{\cong} L_{\mathcal{U}} =$  isomorphism of Lie algebras and  $C^\infty(\mathcal{U})$ -modules;
- $\nabla^0 : \Gamma(T\mathcal{U}) \rightarrow A_{\mathcal{U}} =$  injective morphism of Lie algebras and  $C^\infty(\mathcal{U})$ -modules compatible  $\rho$ ;
- $[\nabla_X^0, \iota \circ \Psi(\gamma)] = \iota \circ \Psi(X \cdot \gamma)$  for any  $X \in \Gamma(T\mathcal{U})$  and any  $\gamma \in \Gamma(\mathcal{U} \times \mathfrak{g})$ .

$S(X \oplus \gamma) = \nabla_X^0 + \iota \circ \Psi(\gamma)$  is a isomorphism of Lie algebroids  $S : \text{TLA}(\mathcal{U}, \mathfrak{g}) \xrightarrow{\cong} A_{\mathcal{U}}$ .

Atlas for  $A =$  family of local trivializations  $\{(\mathcal{U}_i, \Psi_i, \nabla^{0,i})\}_{i \in I}$  with  $\bigcup_{i \in I} \mathcal{U}_i = \mathcal{M}$ .

$\mathfrak{X} \in A$  is decomposed as  $X^i \oplus \gamma^i \in \text{TLA}(\mathcal{U}_i, \mathfrak{g})$  such that  $S_i(X^i \oplus \gamma^i) = \mathfrak{X}|_{\mathcal{U}_i}$ .

The  $X^i$ 's are the restrictions to  $\mathcal{U}_i$  of the global vector field  $X = \rho(\mathfrak{X})$ .

On  $\mathcal{U}_{ij} = \mathcal{U}_i \cap \mathcal{U}_j \neq \emptyset$  one can define  $\alpha_j^i = \Psi_i^{-1} \circ \Psi_j : \mathcal{U}_{ij} \rightarrow \text{Aut}(\mathfrak{g})$ .

$\exists \chi_{ij} \in \Omega^1(\mathcal{U}_{ij}) \otimes \mathfrak{g}$  such that  $\gamma^i = \alpha_j^i(\gamma^j) + \chi_{ij}(X)$ .

Cocycle relations:

$$\alpha_k^i = \alpha_j^i \circ \alpha_k^j \quad \alpha_j^i \circ \alpha_i^j = \text{Id} \quad \chi_{ik} = \alpha_j^i \circ \chi_{jk} + \chi_{ij} \quad \alpha_j^i \circ \chi_{ji} + \chi_{ij} = 0$$

## Trivialization of differential forms

$0 \longrightarrow L \xrightarrow{i} A \xrightarrow{\rho} \Gamma(TM) \longrightarrow 0$  a transitive Lie algebroid.

$\{(\mathcal{U}_i, \Psi_i, \nabla^{0,i})\}_{i \in I}$  a Lie algebroid atlas for  $A$ .

$\omega \in \Omega^q(A, L) \longrightarrow$  family of local  $q$ -forms  $\omega_{\text{loc}}^i \in \Omega_{\text{TLA}}^q(\mathcal{U}_i, \mathfrak{g})$

$$\omega_{\text{loc}}^i = \Psi_i^{-1} \circ \omega \circ S_i$$

$S_i^j = S_j^{-1} \circ S_i : \text{TLA}(\mathcal{U}_{ij}, \mathfrak{g}) \xrightarrow{\cong} \text{TLA}(\mathcal{U}_{ij}, \mathfrak{g}) =$  isomorphism of TLA.

$\widehat{\alpha}_j^i : \Omega_{\text{TLA}}^q(\mathcal{U}_{ij}, \mathfrak{g}) \rightarrow \Omega_{\text{TLA}}^q(\mathcal{U}_{ij}, \mathfrak{g})$  defined by  $\widehat{\alpha}_j^i(\omega_{\text{loc}}^j) = \alpha_j^i \circ \omega_{\text{loc}}^j \circ S_i^j$ .

### Proposition

- A family of local forms  $\omega_{\text{loc}}^i \in \Omega_{\text{TLA}}^\bullet(\mathcal{U}_i, \mathfrak{g})$  is a system of trivializations of a global form  $\omega \in \Omega^\bullet(A, L)$  if and only if  $\widehat{\alpha}_j^i(\omega_{\text{loc}}^j) = \omega_{\text{loc}}^i$  on any  $\mathcal{U}_{ij} \neq \emptyset$ .
- For any  $\omega \in \Omega^\bullet(A, L)$  trivialized on  $\mathcal{U}$  as  $\omega_{\text{loc}}$ , one has  $\widehat{d}_{\text{TLA}} \omega_{\text{loc}} = \Psi^{-1} \circ (\widehat{d}\omega) \circ S$ .
- $\widehat{\alpha}_j^i : \Omega_{\text{TLA}}^\bullet(\mathcal{U}_{ij}, \mathfrak{g}) \rightarrow \Omega_{\text{TLA}}^\bullet(\mathcal{U}_{ij}, \mathfrak{g}) =$  isomorphism of grad. diff. Lie algebras.

## Additional material

## Local mixed basis

$\mathfrak{g}$  the Lie algebra fiber of  $\mathcal{L}$  where  $L = \Gamma(\mathcal{L})$ ,  $\mathcal{U} \subset \mathcal{M}$  open subset which trivializes  $A$ .

$\{E_a\}_{1 \leq a \leq n}$  basis of  $\mathfrak{g}$ ,  $\{\theta^a\}_{1 \leq a \leq n}$  dual basis of  $\mathfrak{g}^*$ .

$\widehat{\omega} \in \Omega^p(A, L)$  and  $\widehat{\omega}_{\text{loc}} \in \Omega_{\text{TLA}}^p(\mathcal{U}, \mathfrak{g})$  its local description:

$$\widehat{\omega}_{\text{loc}} = \sum_{r+s=p} \widehat{\omega}_{\mu_1 \dots \mu_r a_1 \dots a_s}^{\theta} dx^{\mu_1} \wedge \dots \wedge dx^{\mu_r} \wedge \theta^{a_1} \wedge \dots \wedge \theta^{a_s}, \quad \widehat{\omega}_{\mu_1 \dots \mu_r a_1 \dots a_s}^{\theta} : \mathcal{U} \rightarrow \mathfrak{g}$$

⚠  $\theta^a$  is not convenient  $\rightarrow$  inhomogeneous transformations!

$\nabla$  ordinary connection on  $A$ ,  $\widehat{\omega}$  its connection 1-form

$\rightarrow \widehat{\omega}_{\text{loc}} = (A^a - \theta^a)E_a$  with  $A^a \in \Omega^1(\mathcal{U}) \otimes \mathfrak{g}$ ,

$\rightarrow$  the  $\widehat{\omega}^a = A^a - \theta^a \in \Omega_{\text{TLA}}^1(\mathcal{U})$  define the **mixed basis** in  $\Omega_{\text{TLA}}^1(\mathcal{U})$ .

Then one can write

$$\widehat{\omega}_{\text{loc}} = \sum_{r+s=p} \widehat{\omega}_{\mu_1 \dots \mu_r a_1 \dots a_s} dx^{\mu_1} \wedge \dots \wedge dx^{\mu_r} \wedge \widehat{\omega}^{a_1} \wedge \dots \wedge \widehat{\omega}^{a_s}, \quad \widehat{\omega}_{\mu_1 \dots \mu_r a_1 \dots a_s} : \mathcal{U} \rightarrow \mathfrak{g}$$

### Proposition (Homogeneous transformations)

The  $\widehat{\omega}_{\mu_1 \dots \mu_r a_1 \dots a_s}$ 's have homog. transf. in a change of local trivializations.

## Integration along the kernel

$\mathcal{U} \subset \mathcal{M}$  an open subset which trivializes  $A$ .  $\{E_a\}$  basis of  $\mathfrak{g}$ ,  $\{\theta^a\}$  dual basis of  $\mathfrak{g}^*$ .

$\nabla$  a connection on  $A$ ,  $\hat{\omega} \in \Omega^1(A, L)$  its connection 1-form.

$\rightarrow \hat{\omega}^a = A^a - \theta^a \in \Omega_{TLA}^1(\mathcal{U})$  mixed basis in  $\Omega_{TLA}^1(\mathcal{U})$ .

$h$  a metric on  $L$ .

$h_{loc} =$  trivialization of  $h$  over  $\mathcal{U}$ ,  $h_{ab} = h_{loc}(E_a, E_b) \in C^\infty(\mathcal{U})$ ,  $|h_{loc}| = |\det(h_{ab})|$ .

Suppose  $\mathcal{L}$  is orientable where  $L = \Gamma(\mathcal{L})$  ( $A$  is called inner orientable),

### Proposition (Volume form along $L$ and inner integration)

$$\hat{\omega}_{h, \hat{\omega} \text{ loc}} = (-1)^n \sqrt{|h_{loc}|} \hat{\omega}_{loc}^1 \wedge \cdots \wedge \hat{\omega}_{loc}^n$$

defines a global form  $\hat{\omega}_{h, \hat{\omega}} \in \Omega^\bullet(A)$  of maximal degree  $n = \dim \mathfrak{g}$  in the  $L$  direction.

This volume form defines integrations

$$\int_{\text{inner}} : \Omega^\bullet(A, L) \rightarrow \Omega^{\bullet-n}(\mathcal{M}, \mathcal{L}) \qquad \int_{\text{inner}} : \Omega^\bullet(A) \rightarrow \Omega^{\bullet-n}(\mathcal{M}).$$

They do not depend on  $\nabla$ .

## Additional material

## Hodge star operator

$A$  an orientable transitive Lie algebroid.

$\widehat{g} = (g, h, \nabla)$  a metric on  $A$ ,  $\widehat{\omega}$  the connection 1-form of  $\nabla$ .

$\widehat{\omega} \in \Omega^p(A, L)$ , written locally as

$$\widehat{\omega}_{\text{loc}} = \sum_{r+s=p} \widehat{\omega}_{\mu_1 \dots \mu_r a_1 \dots a_s} dx^{\mu_1} \wedge \dots \wedge dx^{\mu_r} \wedge \widehat{\omega}^{a_1} \wedge \dots \wedge \widehat{\omega}^{a_s}$$

$\star \widehat{\omega}_{\text{loc}} \in \Omega_{\text{TLA}}^{m+n-p}(U, \mathfrak{g})$  is defined by (usual notations)

$$\begin{aligned} \star \widehat{\omega}_{\text{loc}} &= \sum_{r+s=p} (-1)^{s(m-r)} \frac{1}{r!s!} \sqrt{|h_{\text{loc}}|} \sqrt{|g|} \widehat{\omega}_{\mu_1 \dots \mu_r a_1 \dots a_s} \epsilon_{v_1 \dots v_m} \epsilon_{b_1 \dots b_n} \\ &\quad \times g^{\mu_1 v_1} \dots g^{\mu_r v_r} h^{a_1 b_1} \dots h^{a_s b_s} dx^{v_{r+1}} \wedge \dots \wedge dx^{v_m} \wedge \widehat{\omega}^{b_{s+1}} \wedge \dots \wedge \widehat{\omega}^{b_n} \end{aligned}$$

### Proposition (Hodge star operator)

The map  $\star : \Omega^p(A, L) \rightarrow \Omega^{m+n-p}(A, L)$  is well defined globally.

This is the Hodge star operator associated to  $\widehat{g}$  on  $A$ .

# Gauge transformations on Atiyah Lie algebroids

Suppose  $G$  is connected and simply connected.

$$\widehat{\omega} \in \Omega_{\text{Lie}}^1(\mathcal{P}, \mathfrak{g}) \mapsto \widehat{\omega}_{\mathfrak{g}_{\text{equ}}} \in \Omega_{\text{TLA}}^1(\mathcal{P}, \mathfrak{g}), \mathfrak{g}_{\text{equ}}\text{-basic.}$$

The gauge action  $\widehat{\omega} \mapsto \widehat{\omega}^u$  induces

$$\widehat{\omega}_{\mathfrak{g}_{\text{equ}}} \mapsto u\widehat{\omega}_{\mathfrak{g}_{\text{equ}}}u^{-1} + u\widehat{d}_{\text{TLA}}u^{-1} \in \Omega_{\text{TLA}}^1(\mathcal{P}, \mathfrak{g})$$

where

$$u\widehat{d}_{\text{TLA}}u^{-1} = udu^{-1} + u\theta u^{-1} - \theta$$

( $\theta = \text{Cartan 1-form}$ )

Notice that  $u\theta u^{-1} - \theta = u[\theta, u^{-1}]$  is more or less “s” applied to  $u$ .

## Proposition (Ordinary gauge transformations)

*If  $\widehat{\omega}_{\mathfrak{g}_{\text{equ}}} = \omega^{\mathcal{P}} - \theta$  is an ordinary connection on  $\Gamma_G(T\mathcal{P})$ , this action reduces to the usual gauge transformation  $\omega^{\mathcal{P}} \mapsto u\omega^{\mathcal{P}}u^{-1} + udu^{-1}$  on the (ordinary) connection 1-form  $\omega^{\mathcal{P}}$ .*

## Decomposition of a connection

$\widehat{\omega} \in \Omega^1(A, L)$  a generalized connection on  $A$ .

### Definition (Reduced kernel endomorphism)

The reduced kernel endomorphism  $\tau \in \text{End}(\mathcal{L})$  associated to  $\widehat{\omega}$  is defined by

$$\tau = \widehat{\omega} \circ \iota + \text{Id}_L.$$

$\tau$  vanishes iff  $\widehat{\omega}$  is an ordinary connection on  $A$

➔ measures the “non Yang-Mills” part.

$\tau$  is not a Lie morphism. Define  $R_\tau(\gamma, \eta) = [\tau(\gamma), \tau(\eta)] - \tau([\gamma, \eta])$  for any  $\gamma, \eta \in L$ .

Let  $\check{\omega} \in \Omega^1(A, L)$  be a fixed ordinary connection on  $A$  (“background connection”).

### Theorem

$\widehat{\omega} \in \Omega^1(A, L)$  a connection and  $\tau$  its reduced kernel endomorphism.

$$\omega = \widehat{\omega} + \tau(\check{\omega})$$

is an ordinary connection on  $A$ .

The induced infinitesimal gauge action of  $L$  is the one on ordinary connections.

$\widehat{\omega}$  ordinary connection ➔  $\tau = 0$  ➔  $\omega = \widehat{\omega}$ .

➔  $\check{\omega}$  only relevant for connections which are not ordinary connections.

## Additional material

## Decomposition of curvature and covariant derivative

$\widehat{\omega} = \omega - \tau(\overset{\circ}{\omega})$  connection on  $A$ .

$\overset{\circ}{\nabla}, \nabla : \Gamma(T\mathcal{M}) \rightarrow A$  the splittings associated to the ordinary connections  $\overset{\circ}{\omega}, \omega$ .

$\overset{\circ}{R}, R \in \Omega^2(\mathcal{M}, \mathcal{L})$  the curvature 2-forms of  $\overset{\circ}{\omega}, \omega$ .

$\widehat{F} = R - \tau \circ \overset{\circ}{R} \in \Omega^2(\mathcal{M}, \mathcal{L}) \mapsto \rho^* \widehat{F} \in \Omega^2(A, L)$ .

For  $X \in \Gamma(T\mathcal{M})$ , define  $\mathcal{D}_X \tau \in \text{End}(\mathcal{L})$  by, for any  $\gamma \in L$ ,

$(\mathcal{D}_X \tau)(\gamma) = [\nabla_X, \tau(\gamma)] - \tau([\overset{\circ}{\nabla}_X, \gamma]) \mapsto (\rho^* \mathcal{D} \tau) \circ \overset{\circ}{\omega} \in \Omega^2(A, L)$ .

$\nabla^{\mathcal{E}}$  the (ordinary) covariant derivative induced on  $\mathcal{E}$  by the (ordinary) connection  $\omega$ .

For any  $\varphi \in \Gamma(\mathcal{E})$ , one has  $\rho^* \phi(\nabla) \cdot \varphi = \rho^* \nabla^{\mathcal{E}} \varphi$ .

## Proposition (Decomposition of the curvature and the covariant derivative)

The curvature  $\widehat{R} \in \Omega^2(A, L)$  of  $\widehat{\omega}$  can be decomposed as

$$\widehat{R} = \rho^* \widehat{F} - (\rho^* \mathcal{D} \tau) \circ \overset{\circ}{\omega} + R_{\tau} \circ \overset{\circ}{\omega}$$

The covariant derivative  $\widehat{\nabla}^{\mathcal{E}} \varphi \in \Omega^1(A, \mathcal{E})$  can be decomposed as

$$\widehat{\nabla}^{\mathcal{E}} \varphi = \rho^* \phi(\nabla) \cdot \varphi - (\phi_L(\tau)\varphi) \circ \overset{\circ}{\omega}$$

Under infinitesimal gauge transformations, each term has homog. transf.

“ $\circ \overset{\circ}{\omega}$ ” = along the mixed basis and “ $\rho^*$ ” = along  $\Gamma(T\mathcal{M})$ .

## Coupling to matter fields

Matter fields are sections  $\varphi \in \Gamma(\mathcal{E})$  of a representation  $\phi : A \rightarrow \mathfrak{D}(\mathcal{E})$  of  $A$ .

### Definition ( $\phi_L$ -compatible metric)

A metric  $h^\mathcal{E}$  on  $\mathcal{E}$  is  $\phi_L$ -compatible if

$$h^\mathcal{E}(\phi_L(\xi)\varphi_1, \varphi_2) + h^\mathcal{E}(\varphi_1, \phi_L(\xi)\varphi_2) = 0$$

for any  $\varphi_1, \varphi_2 \in \Gamma(\mathcal{E})$  and any  $\xi \in L$ .

Generalization of “Killing metric”.

One can define a Hodge star operator on  $\Omega^\bullet(A, \mathcal{E})$ .

$\widehat{\omega}$  connection on  $A$  and  $\widehat{\nabla}^\mathcal{E}$  the induced covariant derivative on  $\Gamma(\mathcal{E})$ .

### Proposition

*The action functional*

$$\mathcal{S}_{\text{Matter}}[\varphi, \widehat{\omega}] = \int_A h^\mathcal{E}(\widehat{\nabla}^\mathcal{E} \varphi, \star \widehat{\nabla}^\mathcal{E} \varphi)$$

*is invariant under infinitesimal gauge transformations in  $L$ .*

# Decomposition of the action functional

$\widehat{\omega}$  connection on  $A$ ,  $\varphi \in \Gamma(\mathcal{E})$  matter field.

$$\mathcal{S}[\varphi, \widehat{\omega}] = \mathcal{S}_{\text{Gauge}}[\widehat{\omega}] + \mathcal{S}_{\text{Matter}}[\varphi, \widehat{\omega}] \quad \text{total action functional}$$

$\widehat{g} = (g, h, \nabla)$ , with  $\nabla \leftrightarrow \dot{\omega} \in \Omega^1(A, L)$ , metric on  $A$ .

The decomposition  $\widehat{\omega} = \omega - \tau(\dot{\omega})$  induces the decomposition:

$$\begin{aligned} \mathcal{S}[\varphi, \widehat{\omega}] = & \langle \rho^* \widehat{F}, \star \rho^* \widehat{F} \rangle & (1) \text{ spatial term: Yang-Mills like} \\ & + \langle (\rho^* \mathcal{D}\tau) \circ \dot{\omega}, \star (\rho^* \mathcal{D}\tau) \circ \dot{\omega} \rangle & (2) \text{ mixed term: covariant derivative of } \tau \\ & + \langle R_\tau \circ \dot{\omega}, \star R_\tau \circ \dot{\omega} \rangle & (3) \text{ algebraic term: potential for } \tau \\ & + \langle \rho^* \phi(\nabla) \cdot \varphi, \star \rho^* \phi(\nabla) \cdot \varphi \rangle & (4) \text{ spatial term: covariant derivative of } \varphi \\ & + \langle (\phi_L(\tau)\varphi) \circ \dot{\omega}, \star (\phi_L(\tau)\varphi) \circ \dot{\omega} \rangle & (5) \text{ algebraic term: coupling } \varphi \leftrightarrow \tau \end{aligned}$$
